Desenvolvimento epistemológico da Sistemática:

Aristóteles – 384-322 A.C.

Darwin – 1809-1882

organismos → fenômeno estrutural
estudos comparativos → reconstrução dos elementos típicos

“All idealistic morphologists subscribed to the same initial idea that the organism is a structural phenomenon and that the purpose of comparative morphological studies must be an exact mental reconstruction of the fundamentals, the typical elements, of this structure. (Levit & Miester, 2006:285)

Transmutacionistas

Johann W. von Goethe
1749–1832

Gestalt → conformação crucial oculta da natureza
Bauplan → plano ideal expresso pelos elementos básicos

'Describing plants, Goethe attempted to reconstruct the crucial conformation (*Gestalt*) of nature as a whole hidden behind the observable things. This was the ultimate objective of his idealistic morphology (Goethe, 1790b, pp. 1817–1823). The type was for Goethe an ideal body plan (*Bauplan*) of an organism partly expressed in the basic elements of real organismic organisation: “Thence appears a proposition about an anatomical type, a general entity, which covers (as far as possible) the structures (*Gestalten*) of all animals and allows to specify each animal in a certain system (Ordnung)” (Goethe, 1932, p. 315).' (apud Levit & Meister, 2006:285)

Buffon
1707-1788

Lamarck

Cuvier
1769 -1832

Desenvolvimento epistemológico da Sistemática:

Aristóteles – 384-322 A.C.

Darwin – 1809-1882

Erro Historiográfico: Tipologismo = essencialismo
Tipo = entidade invariável

Johann W. von Goethe
1749–1832

“[T]ypological theories, as a kind of essentialism, propagated the idea of the type as an invariable entity, which is “sharply demarcated against all other such essences” (Mayr, 2001b, p. 74)

Tipologismo (método):

- * Não requer que as entidades sejam discretas
- * Tipos = abstrações matemáticas

“[T]he typological method does not necessarily require that types are sharply demarcated. In typology, types are mathematical abstractions and it depends on the level and methods of abstraction and on the purposes of the researcher, whether the derived types have sharp boundaries or gradually flow into each other.” (Levit & Meister, 2006:299-300)

Transmutacionistas

Buffon
1707-1788

Lamarck
1744 -1829

St-Hilair
1772 -1844

Cuvier
1769 -1832

Desenvolvimento epistemológico da Sistemática:

Aristóteles – 384-322 A.C.

Darwin – 1809-1882

Johann W. von Goethe
1749–1832

* Instrumento para fazer sistemática e não para discutir fenômenos evolutivos.

* Não rejeitava nem aceitava teorias causais de descendências, pois o programa de pesquisa operava em outra dimensão teórica.

Typology was understood as a tool for doing systematics and was not instrumental for discussing evolutionary mechanisms of any kind. [...] Thus, pure typology was not essential for rejecting or accepting causal theories of descent, because it is a research programme operating in another theoretical dimension. (Levit & Meister, 2006:299)

Transmutacionistas

Buffon
1707-1788

Lamarck
1744 -1829

St-Hilair
1772 -1844

Cuvier
1769 -1832

Desenvolvimento epistemológico da Sistemática:

Aristóteles – 384-322 A.C.

Darwin – 1809-1882

No começo do século XVII, as crenças tradicionais estavam sendo abaladas por uma série de questionamentos sobre a constância e estabilidade do mundo. [...]

A teologia cristã derivou o fixismo das espécies da narrativa da criação do Gênesis. Fixismo tem sido sustentado pelas doutrinas do idealismo Platônico e o essencialismo Aristotélico. [...]

Darwin's job was like that of Copernicus – the overthrow of an ancient belief in stability.

(Amindson, 2005:35)

Carolus Linnaeus
1707-1778

Transmutacionaistas

Buffon
1707-1788

Lamarck
1744 -1829

Aristóteles – 384-322 A.C.

Darwin – 1809-1882

Carolus Linnaeus
1707-1778

Fixismo: amplamente aceita entre naturalistas e teólogos durante o século XVIII.

Linnaeus: referências ao fixismo e criacionismo

Transmutacionaistas

Buffon
1707-1788

Lamarck
1744 -1829

St-Hilaire
1772 -1844

Cuvier
1769 -1832

“It may come as a surprise to the reader (as it certainly did to the author) that the fixity of biological species is not an ancient belief. It became widely accepted for the first time both among naturalists and theologians during the eighteenth century, only about a century before Darwin (Zirkle 1951 : 48–49; Zirkle 1959 : 642). Carl Linnaeus is widely known for his unequivocal statements of species fixism and special creationism.”
(Amindson, 2005:35)

Desenvolvimento epistemológico da Sistemática:

Aristóteles – 384-322 A.C.

Darwin – 1809-1882

Biologia evolutiva: criou o cenário sobre o qual se construiria o *Systema Naturae*.

Imagine construir uma sistema de taxonomia coerente no qual trigo poderia dar origem à centeio, vermes à insetos, barro à sapos e cracas a gansos.

(Amundson, 2005, p. 37-38)

Carolus Linnaeus
1707-1778

“Species fixism was important to the origin of evolutionary biology because it set the stage for the construction of the Natural System. [...]

This systematic pattern was constructed between the time of Linnaeus and Darwin. It was called the Natural System. Species fixism was necessary to the growth of the Natural System.

(Amundson, 2005, p. 37-38)

Transmutacionistas

Buffon
1707-1788

Lamarck
1744 -1829

St-Hilaire
1772 -1844

Cuvier
1769 -1832

Desenvolvimento epistemológico da Sistemática:

Aristóteles – 384-322 A.C.

Darwin – 1809-1882

Essencialismo: doutrina sobre as entidade naturais.

A triangle cannot change into a square because their essences are distinct.

vs.

Transmutacionistas

Fixismo: doutrina sobre relações causais.

The causal relation of generation between parents and offspring.

Carolus Linnaeus
1707-1778

"**Essentialism** is a doctrine about natural kinds, not about the causal relations between these kinds. Its paradigmatic application is to items like geometric figures: A triangle cannot change into a square because their essences are distinct. In contrast, species fixism is a doctrine about causal relations – the causal relation of generation between parents and offspring. Essentialism may entail that a dog cannot transform into a cat, but it cannot (by itself) entail that a dog cannot give birth to a cat."

(Amundson, 2005, p. 209).

A revolução que falhou: filosofia da ciência

Darwin (1859:420): **Seleção natural** → Método de inferência considerado não científico diante do paradigma empiricista (positivismo lógico) da época.

"Even if the theory of natural selection were as firmly established as Newton's theory of the attraction of gravity, scientific method would still require frequent examination of its claims, and scientific honesty should welcome such examination and insist on its thoroughness."

Bumpus (1899)

Hermon Carey Bumpus (1862-1943)*

A revolução que falhou: filosofia da ciência

Darwin (1859:420): "community of descent is the hidden bond which naturalists have been unconsciously seeking, and not some unknown plan of creation, or enunciation of general propositions, and the mere putting together and separation of objects more or less alike"

Huxley(1874:101): "Darwin, by laying a novel and solid foundation for the theory of Evolution, introduced a new element into Taxonomy. Is species, like an individual, is the product of a process of development, its mode of evolution must be taken into account in determining its likeness or unlikeness to other species; and thus **"phylogeny" becomes not less important than embryogeny to the taxonomist.** But while the logical value of phylogeny must be fully admitted, it is to be recollected that, in the present state of science, absolutely nothing is positively known respecting the phylogeny of any of the larger groups of animals. Valuable and important as **phylogenetic speculations** are, as guides to, and suggestions of, investigation, they are pure **hypotheses incapable of any objective test**; and there is no little danger of introducing confusion into science by mixing up such hypotheses with Taxonomy, which should be a precise and logical arrangement of **verifiable facts.**"

1960's

Theodosius Dobzhansky
1900 - 1975

“The first period was initiated by the publication of *Genetics and the Origin of Species* (1937) by the Russian-born American evolutionist Theodosius Dobzhansky (1880–1959).

[...]

The second period in the development of the Synthesis, after 1947, Mayr labelled “post-Synthesis” to emphasise that in this period Darwinians were in agreement about the fundamental principles; the post-Synthetic developments just specified and strengthened an already existing paradigm.”

1902 - 1984

A revolução que se inicia

Genética Populacional: R. A. Fisher (1890-1962), J. B. S. Haldane (1892-1964) e Sewall Wright (1889-1988).

Introduziram modelos matemáticos à biologia, e testaram os limites teóricos dos processos evolutivos dado algumas premissas.

Fisher (1930): Teorema fundamental da seleção natural.

Por aproximadamente um século após *A origem das espécies* (Darwin, 1859) não havia nenhuma escola de classificação bem definida. Não havia metodologias competindo entre si. No entanto, havia unanimidade em reconhecer que classificações deveriam reconhecer “grau de parentesco” entre os organismos.
